

At Dunblane, we are selecting aggressively for increased wool cut to maximize fleece values. Wool quality is critical and we want easy care sheep that do not require mulesing and produce a bright white sound wool with minimal fault. We are looking for medium framed sheep that will give us maximum conversion efficiency of pasture into wool. We want our trade wethers hitting the grid at 22-23kg CWT. Moderate emphasis has been placed on Fat and Muscle in our AI programs to improve the resilience of our flock in tough seasons and for fertility.

**Merino  
Rams for  
sale  
\$500/hd**

## Objectively measured merino rams for sale

We have been breeding rams for our own purposes for over 10 years. Our ram breeding process follows “world’s best practice” guidelines, as outlined by Sheep Genetics Australia. We are now offering an opportunity to buy high quality objectively measured rams at competitive prices.

*The 2015 AI program included ‘Hazeldean 03542’, Australia’s leading proven sire on the merinosuperiorsires website.*

## Highlights of the 2020 drop rams:

Rams bred in western QLD from a genuine 18-19 $\mu$  medium frame merino flock. All rams are low to moderate wrinkle score and are unmulesed. Both poll & horn rams available.

Ram selection is based on objective measurement techniques, traits measured include FD, CFW, SL, SS, and body weight. A comprehensive list of measurements is available with all rams.

Breeding Indexes available for all rams, including MP 7% and Dual Purpose indexes. (within flock)

All rams classed for structural and wool fault, wool quality measurements also presented in catalogue.

Only rams ranked above average on index are offered for sale. Over 240 rams assessed in this year’s analysis to find our Top sires. Approx. 100 rams offered for sale.

All rams for sale are bred from Australia’s best proven sires.

## Breeding Objective

Our flock breeding objective is based on a MP 7% index. This index selects for equal improvement in clean fleece weight and reduction in fibre diameter, with a moderate increase in bodyweight. Our AI programs included a moderate emphasis on Fat and Muscle ASBV’s.

*Not only are we collecting measurements on our rams, we rely heavily on these for selection purposes.*
